Name of Title: Ground Crew Operations Management for Airline Services

1. Abstract:

Ground Crew Operations Management for Airline Services is a web-based application developed to support the planning and execution of airport ground activities. Ground handling involves multiple tasks such as aircraft cleaning, fueling, catering, and baggage management, all of which must be completed within strict time limits. Managing these activities manually can lead to delays, miscommunication, and inefficiencies. This application provides a structured solution to improve coordination among ground crew members and ensure timely task completion.

The platform offers a centralized interface where tasks related to each flight are created and displayed. Supervisors can assign tasks to crew members, and the progress of each task can be updated in real time. Tasks are categorized based on their status, allowing users to easily identify pending, ongoing, and completed work. A timer feature records the duration of tasks, helping teams monitor performance and maintain schedules.

Each task includes a checklist to ensure that all required steps are completed before it is marked as finished. The application also generates notifications to inform users about important updates, such as task completion or delays. This improves communication and helps teams respond quickly to changing conditions.

A history module stores records of all task activities, enabling review and analysis of past operations. Reports can be generated and exported for documentation purposes. An administrative panel allows the management of flight details, crew information, and task assignments.

The application is built using technologies such as React.js for the user interface and Node.js with Express.js for backend operations. Data storage can be handled using MySQL or local storage. Overall, the application helps improve organization, reduce delays, and enhance the efficiency of airline ground operations.
